DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

1. Claims 1-3 are rejected under 35 U.S.C. 102(b) as being anticipated by Meier (US 4559878).

Regarding claim 1, Meier discloses a wavelength variable light outputting apparatus comprising a light source outputting light having a plurality of wavelengths, (see column 3 lines 10-15), a swinging first galvanometric scanner provided with spectroscopic means for spectrally dividing said light outputted from said light source, a swinging second galvanometric scanner provided with a shielding or reflecting member adapted to block or reflect at least a part of light outputted from said spectroscopic means (see column 5 lines 33-38 and lines 56-57, column 6 lines 54-60). Additionally, Meier discloses an optical fiber disposed at a position where light outputted from said spectroscopic means can be made incident by way of said shielding or reflecting member.

Regarding claim 2, Meier discloses storage means (process controller 14) for storing respective swinging angles of said first and second galvanometric scanners and a relationship between wavelength and quantity of light outputted from said optical fiber in response to a combination of said swinging angles, input means (wavelength calibrator 13) for inputting information concerning wavelength and quantity of light to be outputted from said optical fiber, and control means (see intensity monitor 12) for reading out said relationship from said storage

means according to said information fed into said input means and controlling said swinging angles of said first and second galvanometric scanners in response to said relationship.

Regarding claim 3, Meier discloses control means for changing a wavelength of light outputted from said optical fiber so as to have constant intensity of light while changing the wavelength.
